Board Connect

V4 Update Instructions

Board Connect – V4.0 Installation Notes

Today's release is a major change to Board Connect. It brings in many new features and capabilities and simplifies many of the processes for how board administrators, board members and other roles operate within your organisation.

For more information about the release, please read here.

As part of our release, the Board Connect solution will require a Global Administrator from your tenancy to log into the application and accept the permissions once more.

For existing installations of Board Connect, please undertake the following steps. Please note, you will only need to do this in one team, with the updated permissions taking effect across all.

1. Logged in as a Microsoft 365 - Global Administrator, browse to a team that contains Board Connect as a tab
2. The user with Global Administrator rights will be prompted to accept the new permissions required from the application
3. A list of permissions requested will be displayed click **Consent on behalf of your organisation**

4. Click **Accept** for the application to continue operation

What permissions have we changed?

Manage user's installed teams

We have added the Graph API permissions relating to managing TeamsAppInstallations for Users. These Graph API's allows Board Connect to add the application to the logged on users list of personal apps by default.

- TeamsAppInstallation.ReadForChat
- TeamsAppInstallation.ReadWriteForUser
- TeamsAppInstallation.ReadWriteSelfForUser

Manage Channel Members

Add and remove members from channels on behalf of the signed-in user. The addition of this Graph scope also allows changing a member's role. For example from channel owner to channel member.
